

Application Note

ACT 8500/1/2/3/4/5 **Analog Multiplexer Module Series**

The relationship of the enable signals to the address signals

Aeroflex recommends the following conservative practice in using the Analog Multiplexer modules.

Each module must be enabled for the minimum TON enable specification before the chip address lines can be changed. The chip enable is active low.

Therefore the enable line shall be enabled low for a minimum of 1.5 μ sec before the address lines are changed.
