FEATURES

- ACT4406N transceiver meets MIL-STD-1553A & B, Macair A3818, A4905, A5232 and A5690 specs
- Bipolar supply $\pm 15V$ to $\pm 12V$, logic supply +5V
- Monolithic construction
- Direct replacement for ARX3404
- Voltage source output
- Designed for commercial, industrial and aerospace applications
- MIL-PRF-38534 compliant devices available
- Aeroflex-Plainview is a Class H & K MIL-PRF-38534 manufacturer
- DESC SMD #5962-8959207 approved

GENERAL DESCRIPTION

The Aeroflex-Plainview transceiver model ACT4406N is a new generation monolithic transceiver which provide full compliance with Macair and MIL-STD-1553 data bus requirements.

The model ACT4406N performs the front-end analog function of inputting and outputting data through a transformer to a MIL-STD-1553 or Macair data bus. The ACT4406N can be considered a "Universal" Transceiver in that it is compatible with MIL-STD-1553A/B, Macair (A-3818, A-4905, A-5232 and A-5690).

Design of these transceivers reflects particular attention to active filter performance. This results in low bit and word error rate with superior waveform purity and minimal zero crossover distortion. The ACT4406N active filter design has additional high frequency roll-off to provide the required Macair low harmonic distortion waveform without increasing the pulse delay characteristics significantly.

Efficient transmitter electrical and thermal design provides low internal power dissipation and heat rise at high and well as low duty cycles.

TRANSMITTER

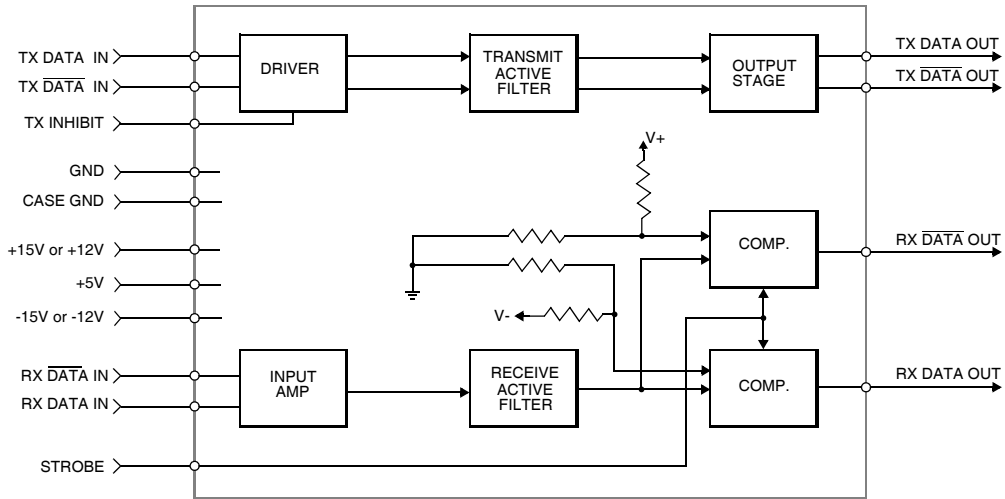

The Transmitter section accepts bi-phase TTL data at the input and when coupled to the data bus with a 1:1 transformer the data bus signal produced is 7.0 Volts typical P-P at point A-A' (See Figure 3 or 4). When both DATA and $\overline{\text{DATA}}$ inputs are held low or high, the transmitter output becomes a high impedance and is "removed" from the line. In addition, an overriding "INHIBIT" input provides for the removal of the transmitter output from the line. A logic "1" applied to the "INHIBIT" takes priority over the condition of the data inputs and disables the transmitter (See Transmitter Logic Waveforms - Figure 1).

The transmitter utilizes an active filter to suppress harmonics above 1 MHz to meet Macair specifications A-3818, A-4905, A-5232 and A-5690. The transmitter may be safely operated for an indefinite period at 100% duty cycle into a data bus short circuit.

RECEIVER

The Receiver section accepts bi-phase differential data at the input and produces two TTL signals at the output. The outputs are DATA and $\overline{\text{DATA}}$, and represent positive and negative excursions of the input beyond a pre-determined threshold (See Receiver Logic Waveforms - Figure 2).

The internal threshold is nominally set to detect data bus signals exceeding 1.10 Vp-p and reject signals less than 0.6 Vp-p when used with a 1:1 turns ratio transformer (See Figure 3 or 4 for transformer data and typical connection). A low level at the "STROBE" input inhibits the DATA and $\overline{\text{DATA}}$ outputs. If unused, a 2K Ohm pull-up to +5VDC is recommended.

BLOCK DIAGRAM (WITHOUT TRANSFORMER)

- Notes:
1. Line to line waveforms illustrate Macair signals, MIL-STD-1553 signals are trapezoidal.
 2. DATA and $\overline{\text{DATA}}$ inputs must be complementary waveforms or 50% duty cycle average, with no delays between them.
 3. DATA and $\overline{\text{DATA}}$ must be in the same state during off time (both high or low).

Recommended Power Supply Voltage Range

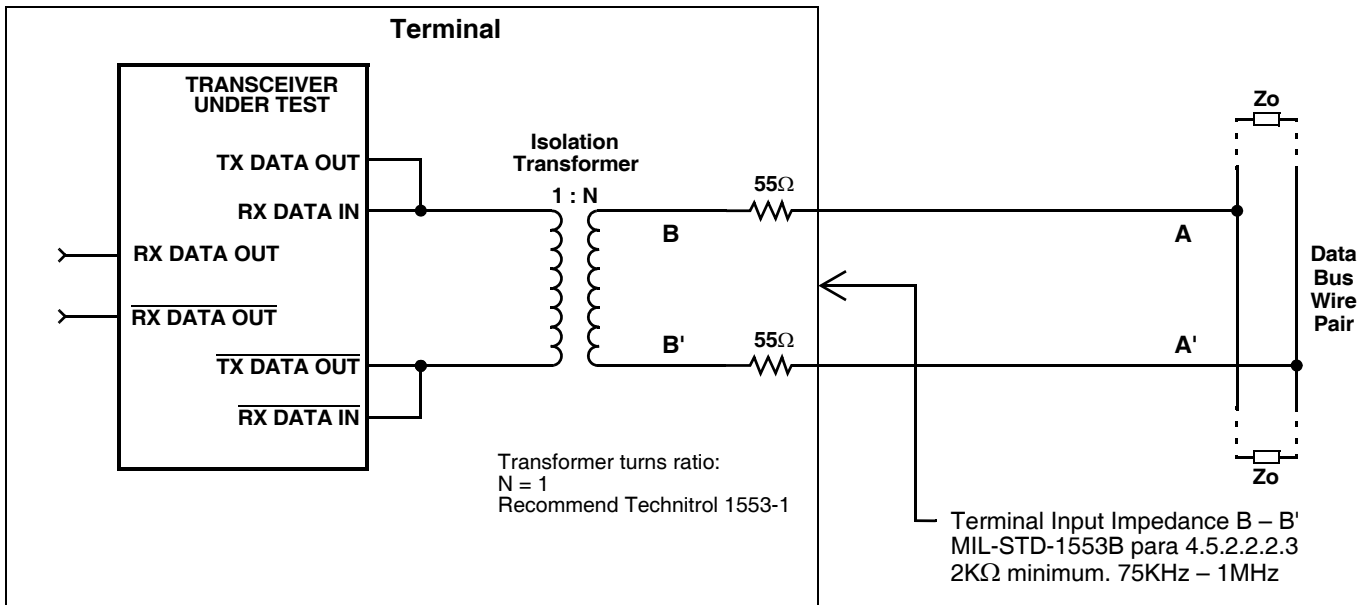

+V	+11.4 Volts to +15.75 Volts
-V	-11.4 Volts to -15.75 Volts
Logic	+4.5 Volts to +5.5 Volts

Notes:

- V_{CC} = +15VDC ±0.75V, V_{EE} = -15V. V_{CC} = +15VDC ±0.75V, V_{IL} = +5VDC ±0.5V, T_C = -55°C to +125°C, unless otherwise specified.
- All typical values are measured at +25°C.
- Characteristics guaranteed by design, not production tested.
- Power ON/OFF, measured from 75KHz to 1MHz at Point A-A' Figure 4, in accordance with MIL-STD-1553B paragraph 4.5.2.2.2.3.
- At point A-A' on Figure 3 or 4, 2.5μS after midpoint crossing of the parity bit of the last word of a 660 μS message.
- Receiver skew is defined as the time from the rising edge of RX DATA OUT to the rising edge of RX $\overline{\text{DATA}}$ OUT minus 500 nS, with a sine wave input of 3 VP-P at 1MHz driven into Point B-B' of Figure 4 or 2.1 VP-P at 1MHz driven into Point B-B' of Figure 3. The specification maximum is guaranteed for T_A = 25°C only. Standard TTL loads applied to RX DATA Outputs.
- This test is performed while the Transceiver is reading its own transmission. This condition is called "Wraparound". Standard TTL loads applied to RX DATA Outputs.
